

FORMTEK METAL FORMING, INC.

FOR IMMEDIATE RELEASE

No longer dependent on raw material suppliers for screen frames or muntins, window manufacturers can produce both in a just-in-time scenario with the SFM-Series Roll Former from Winpro. Production files from a central office computer are sent to the roll former's control allowing the machine to manufacture the screens in a production format. This technology reduces scrap, inventory levels, floor space and labor while providing the fabricator with the security to control production levels and quality. Winpro manufactures the SFM-Series in North America and utilizes only top-of-the-line components. A welded steel base and a 2" thick solid steel center rail provide the backbone of this very robust machine. The ten horsepower AC motor supplies more than enough power to form even the most difficult shapes. The rolls are designed and manufactured at the company's facility in Cleveland, Ohio utilizing the highest quality steel. The SFM-Series Roll Former from Winpro is one of the industries fastest and most flexible machines available today. This innovative roll former is designed to manufacture up to four unique shaped screen frames or muntins without changing the roll tooling. With a maximum speed of 150' per minute, the SFM-Series is capable of producing 63,000' of finished product per shift. Contact Winpro for more information at www.winproformtek.com.
